
Cortisol Case Challenges

Patient Case Review for Effective Identification and Management of Cushing Syndrome

Presented by

Cornerstone Medical Education

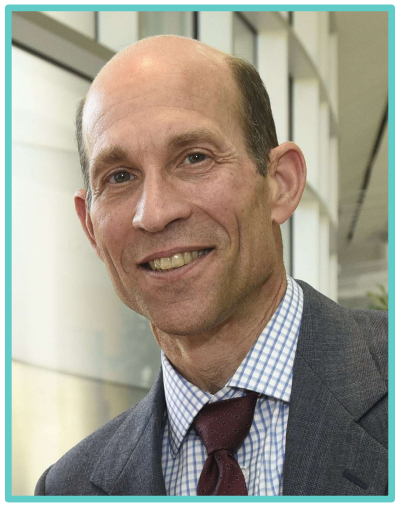
AACME®
AMERICAN ACADEMY OF CME, INC.

Supported by an educational grant from Corcept Therapeutics

Faculty Information

Iacopo Chiodini, MD
Associate Professor of Endocrinology
University of Milan
Director of the Endocrine Unit
Niguarda Hospital
Milan, Italy

Faculty Information



Richard J. Auchus, MD, PhD, FACE
The James A. Shayman and Andrea S. Kevrick
Professor of Translational Medicine
Division of Metabolism, Endocrinology and Diabetes
Departments of Internal Medicine and Pharmacology
University of Michigan Medical School
Ann Arbor, MI

Disclosures

Faculty Disclosures

- Iacopo Chiodini, MD (Faculty):
  - Advisory Board/Consultant: Corcept Therapeutics; Esteve-HRA; Board Member: Scientific Committee of The Italian Society for Osteoporosis and Metabolic Bone Diseases
- Richard J. Auchus, MD, PhD, FACE (Faculty):
  - Advisory Board/Consultant: Quest Diagnostics, Corcept Therapeutics, Xeris Pharmaceuticals, Crinetics Pharmaceuticals, Novo Nordisk, Neurocrine Biosciences & Neurocrine UK, LTD, Recordati Rare Diseases, H Lundbeck A/S, Sparrow Pharmaceuticals, Astellas Pharmaceuticals, Acerand Therapeutics, OMass Therapeutics, Blue Earth Diagnostics, LTD, Spruce Biosciences, Aspect Biosystems, Merck Sharp & Dohme, LLC, Vertex Pharmaceuticals; Grant/Research Support: Neurocrine Biosciences, Neurocrine UK, LTD, Spruce Biosciences, Corcept Therapeutics, Crinetics Pharmaceuticals, Recordati Rare Diseases, Adrenas Therapeutics, Mineralys Pharmaceuticals, H Lundbeck A/S

Planner/Reviewer Disclosures

- Amy Burmesch, PA-C (Reviewer): Speaker's Bureau: Corcept Therapeutics
- Skand Shekhar, MD, MHSc (Reviewer) has no relevant relationships to disclose.
- American Academy of CME and Cornerstone Medical Education (Planners) have no relevant relationships to disclose.

All relevant financial relationships listed for these individuals have been mitigated.

Please note, this activity will include discussion of off-label uses of approved agents and/or investigational data.

Accreditation and Credit Designation

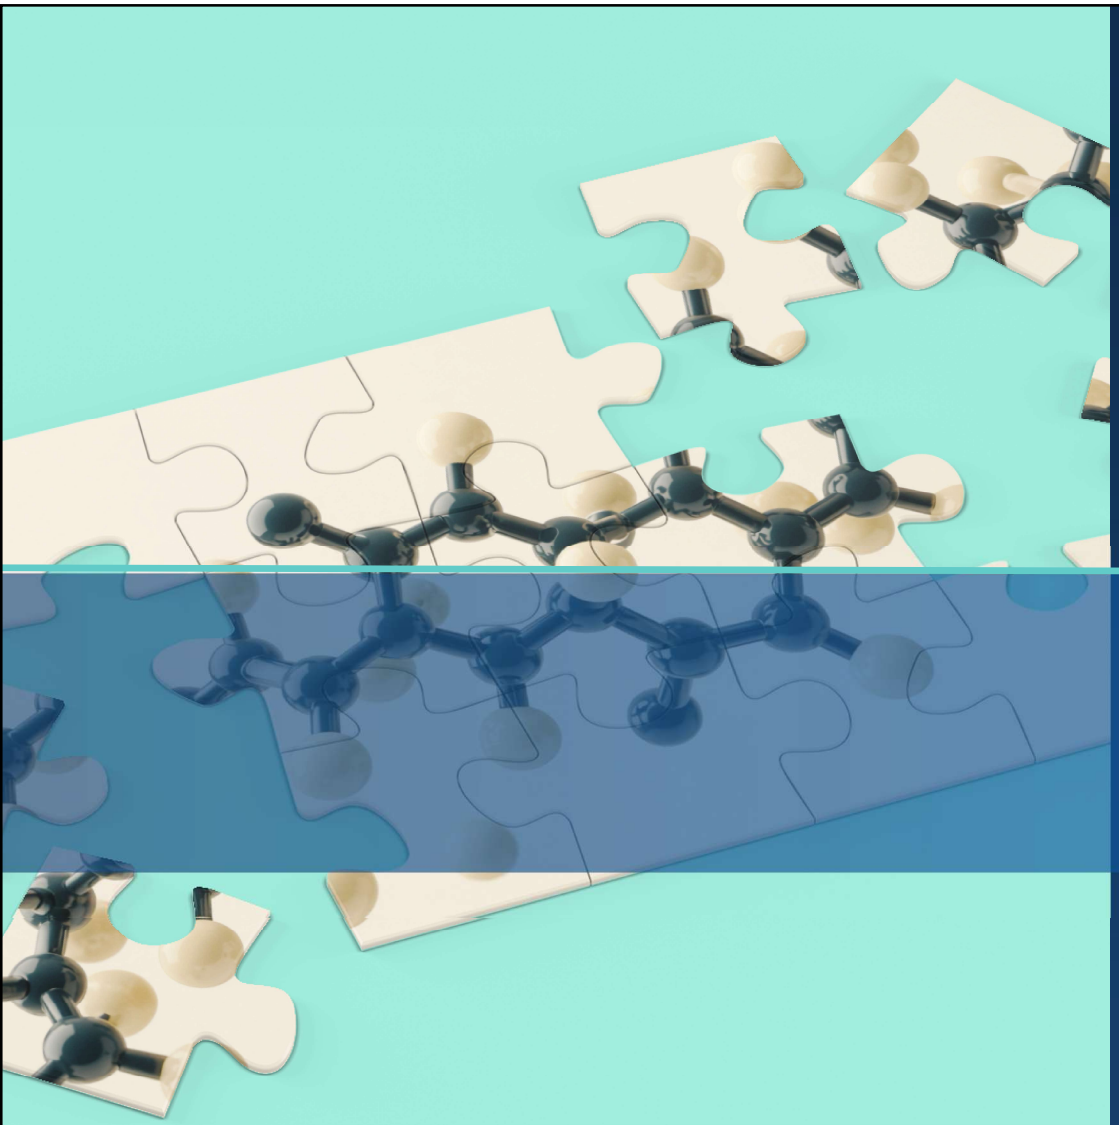
In support of improving patient care, this activity has been planned and implemented by American Academy of CME, Inc. and Cornerstone Medical Education. American Academy of CME, Inc. is Jointly accredited by the Accreditation Council for Continuing Medical Education (ACCME), the Accreditation Council for Pharmacy Education (ACPE), and the American Nurses Credentialing Center (ANCC), to provide continuing education for the healthcare team.

See the Activity Description Page for information about credits offered for this activity.

Learning Objectives

- Develop individualized, evidence-driven medical management plans for patients with Cushing Syndrome.
- Apply the principles of shared decision-making and team-based care to real-world patient cases, focusing on initial treatment and monitoring/follow-up of patients with Cushing Syndrome.

To claim your credit for this activity, please be sure to complete the posttest and evaluation at the conclusion of the presentation.



Cortisol Case Challenges

Patient Case Review for Effective Identification and Management of Cushing Syndrome

Hypercortisolism/Cushing Syndrome

Review of Part 1

- High Index of Suspicion
  - Diabetes, Hypertension, Osteoporosis, Treatment Resistance
- Increased Morbidity & Mortality From Any Severity
- Forms of Hypercortisolemia
  - ACTH-Dependent: Cushing Disease, Ectopic ACTH; Rare
  - ACTH-Independent: Adrenal Tumors; Not Rare
  - Non-Neoplastic: Chronic Illness, Stress; Common
- Surgery is Primary Treatment of Neoplastic CS
- Medical Therapy When Surgery Ineffective
  - Pros & Cons of Each Drug

Cushing Syndrome Features

Specific Features

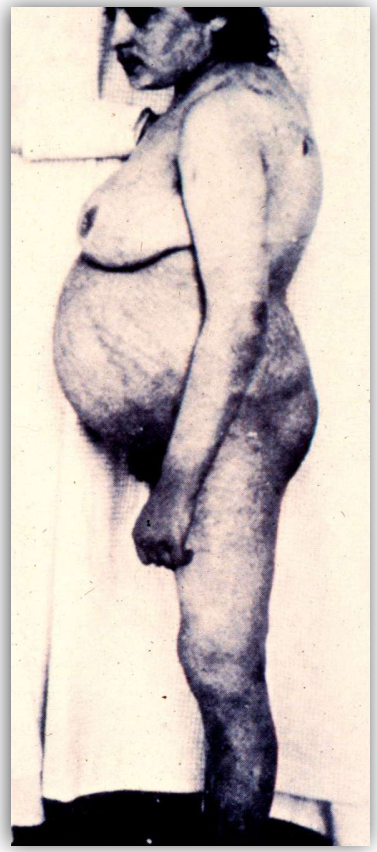
- Proximal Muscle Weakness/Myopathy
- Osteoporosis
- Wide, Purple, Non-blanching Striae
- Easy Bruising Without Anticoagulant Therapy

Common Less Specific Findings

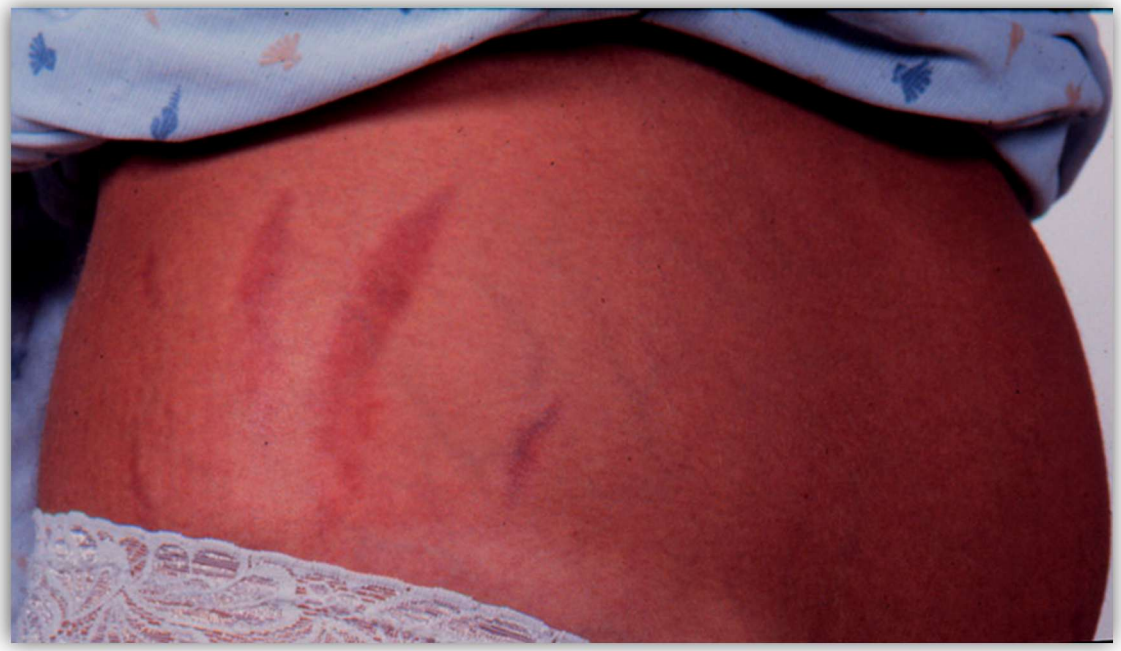
- Dermal Atrophy
- Disproportionate Head & Neck (SC/DC) Fat
- Poor Sleep
- Unexplained Hyperglycemia/HTN/Bone Loss

Fleseriu M, et al. *Lancet Diabetes Endocrinol*. 2021; Gadelha M, et al. *Lancet*. 2023; Nieman LK, et al. *J Clin Endocrinol Metab*. 2015.

Classical Cushing Syndrome



- **Specific Overt Physical Findings & Stigmata**
- **Rare Disease 1:10,000-100,000**
- Majority are ACTH-Dependent, Pituitary > Ectopic



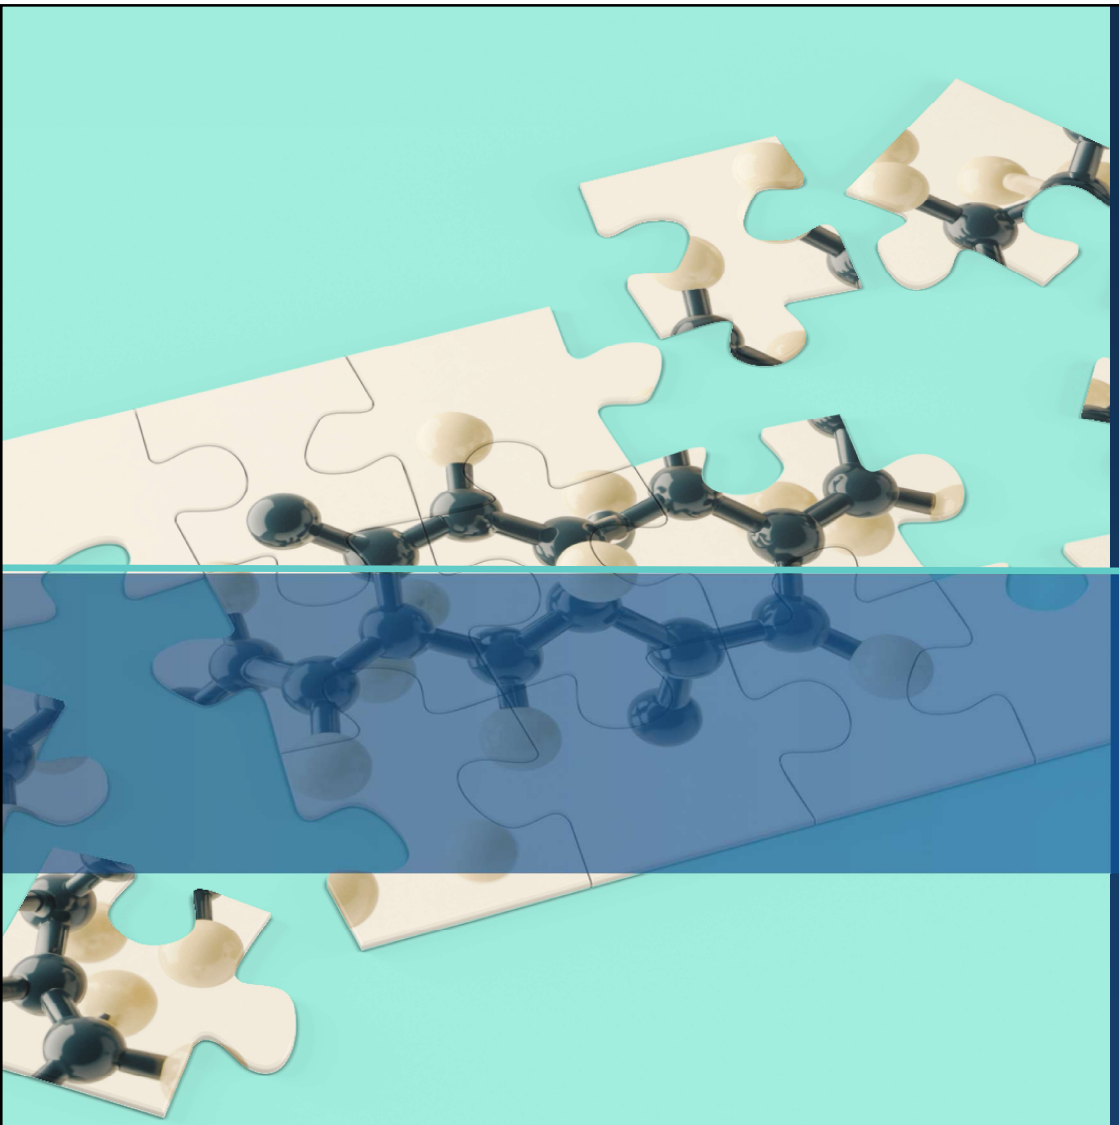
1995

2003

Hypercortisolemia
Principles of Testing

- Cortisol Production is Elevated
  - Urinary Free Cortisol
  - Not Always High, Varies With Assay
- Cortisol Production is Not Suppressible
  - Dexamethasone Suppression
  - Most Sensitive for ACTH-Independent
- The Diurnal Rhythm is Blunted
  - Nocturnal Serum or Saliva Cortisol
  - Saliva Cortisol Now Routine

Fleseriu M, et al. *Lancet Diabetes Endocrinol*. 2021; Gadelha M, et al. *Lancet*. 2023; Nieman LK, et al. *J Clin Endocrinol Metab*. 2015.



Case 1

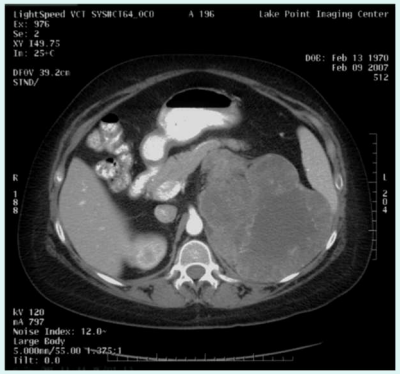
37yr old female with abdominal pain

Case 1 Presentation

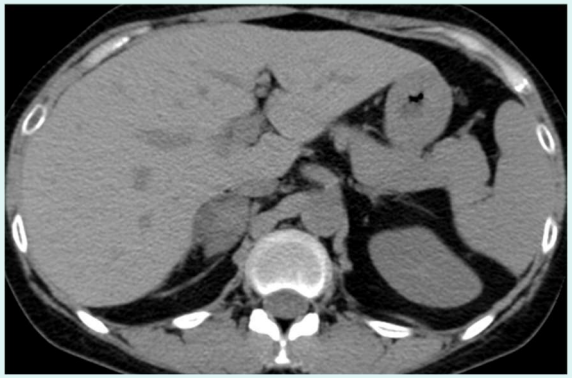
- 37 years old WF, New Onset HTN, Impaired Fasting Glucose
- CT for Abdominal Pain: 2.3 cm Left Adrenal Mass
- ROS: Mild Weight Gain, Regular Menses
- PE: Mild Suggestive Features – Facial Plethora, Moon Facies, Dermal Atrophy, SC Fat Pads, Central Obesity

ACTH-Independent Hypercortisolemia

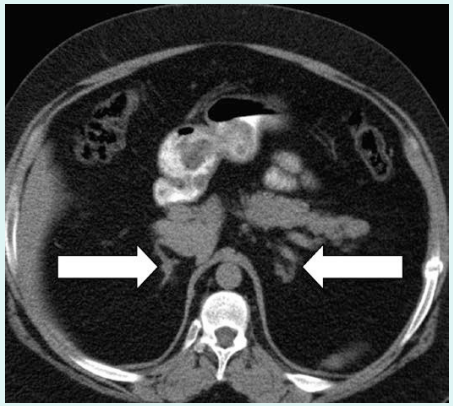
Adrenocortical Carcinoma



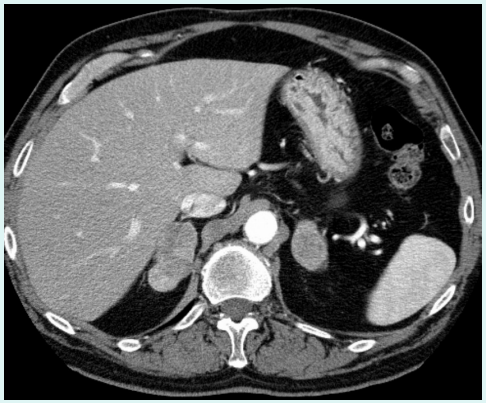
Adrenocortical Adenoma



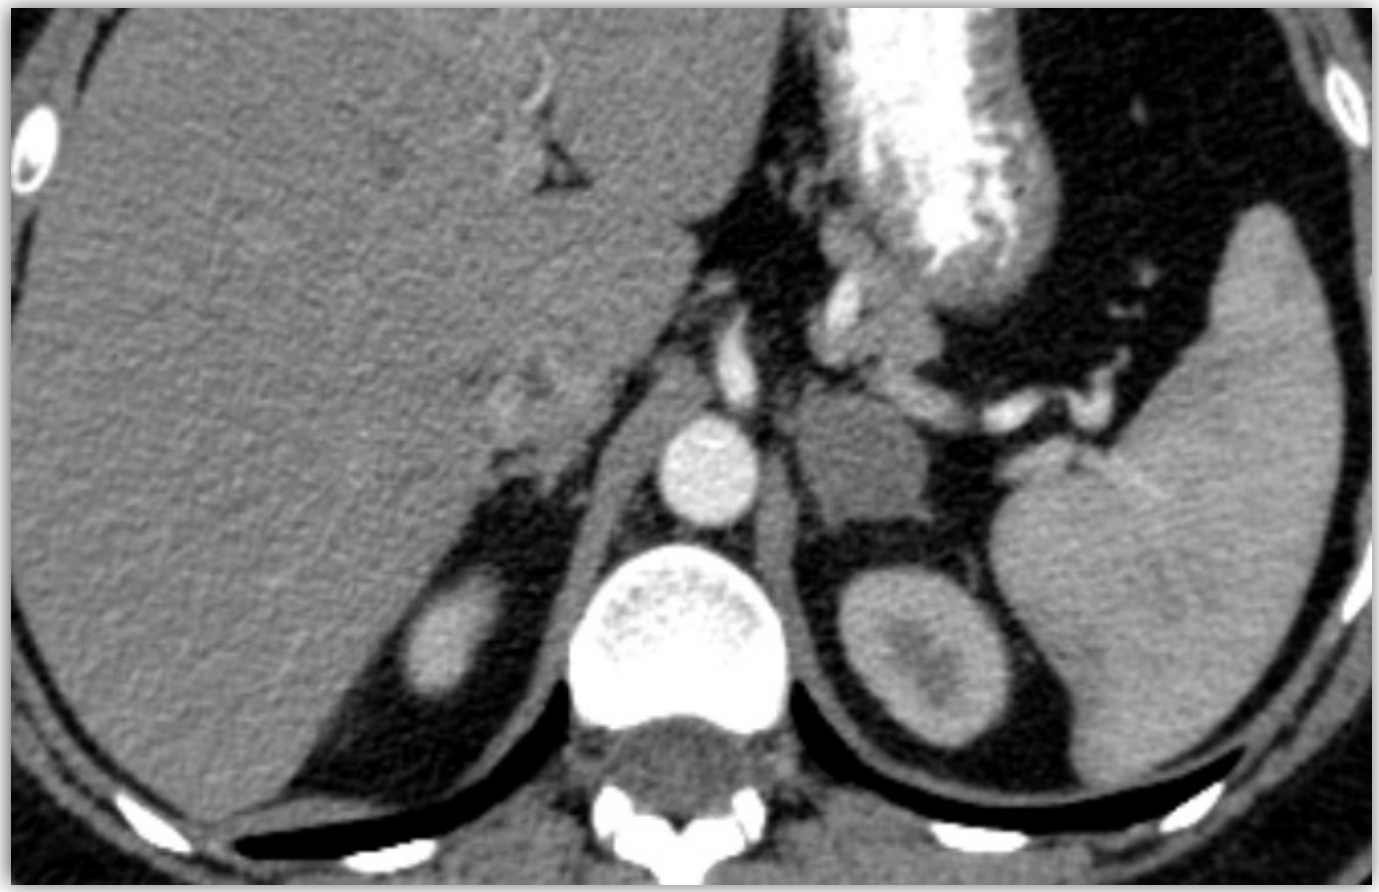
Micronodular Hyperplasia



Macronodular Hyperplasia



Case 1: CT Scan 10/2013 2.3 cm



Case 1 continued

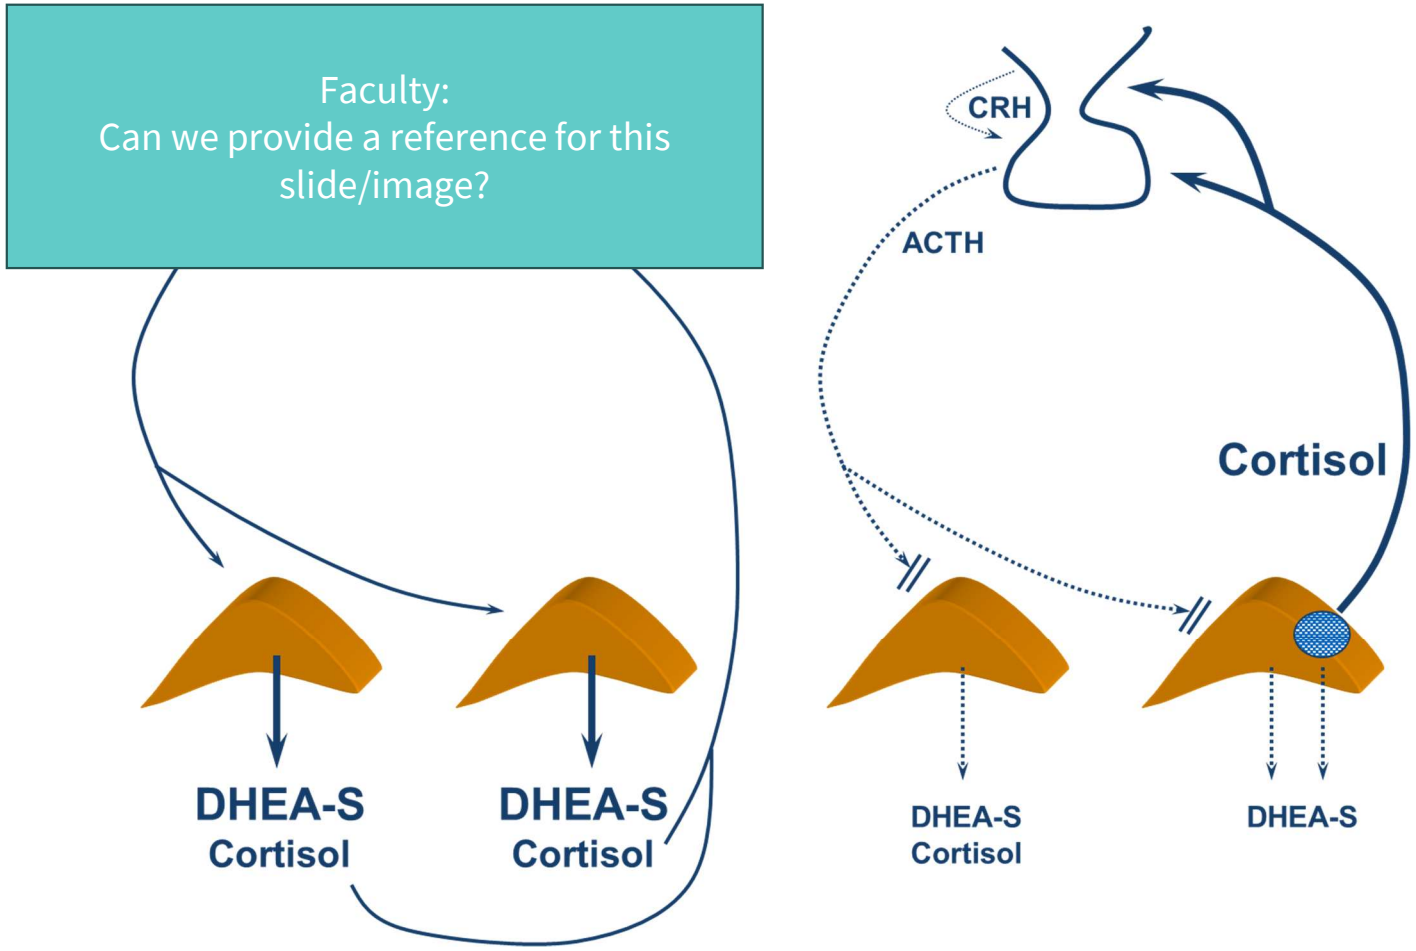
- Initial Laboratory Testing
- ONDST Cortisol 1.4 µg/dL
- Plasma ACTH 14 pg/mL
- Serum DHEAS 126 µg/dL
- Interpretation? Follow-up?

- **Not Strictly Normal But Not Diagnostic**
- **Repeat CT 1 Year**
- **If Stable No Further Testing or FU**

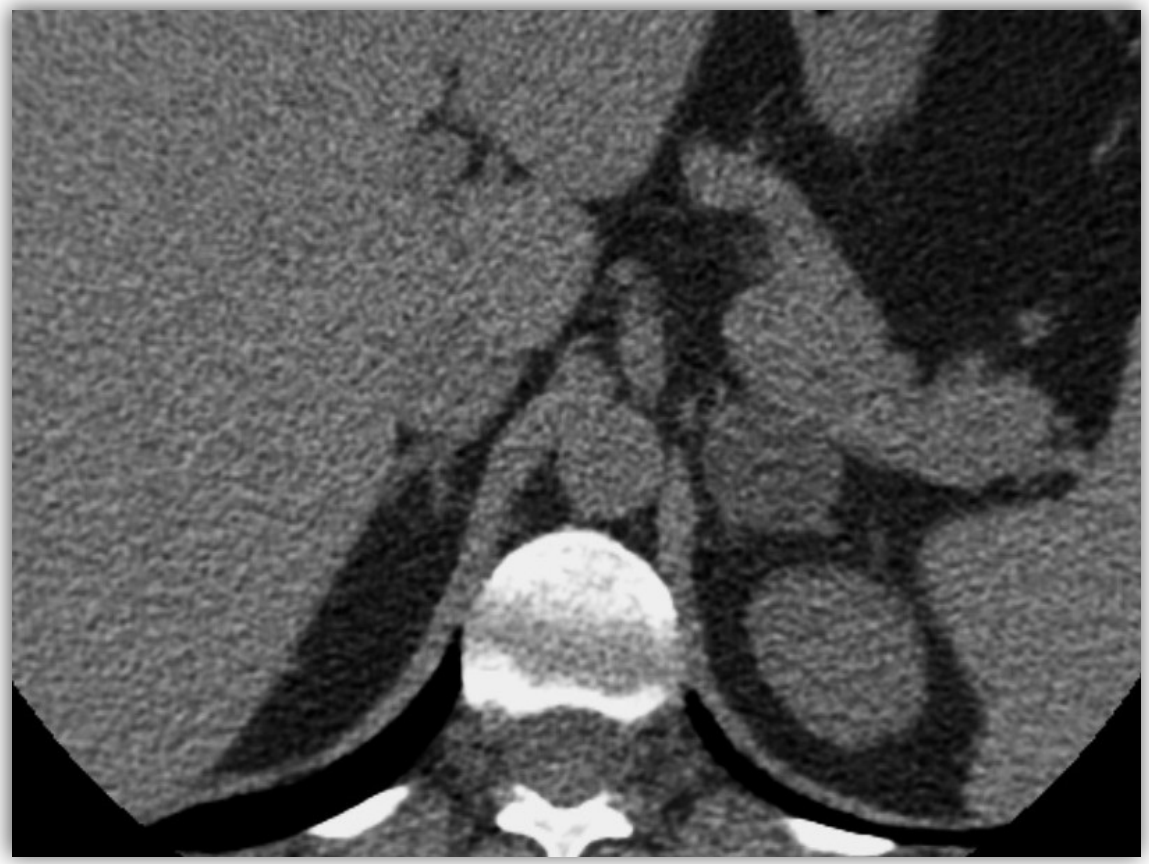
Adrenal Cortex Tumors
Hypercortisolemia Testing

- Overnight 1 mg DST
  - Or 2-3 mg – Suppress ACTH Completely
- Plasma ACTH
  - Must Be Done By 0830, Low Stress
- Serum DHEAS
  - Useful in Patients <65 YO
  - Corroborates Low ACTH
- Repeat Equivocal Labs In 6-12 Weeks

Faculty:
Can we provide a reference for this slide/image?



Case 1: CT Scan 11/2014 2.9 cm



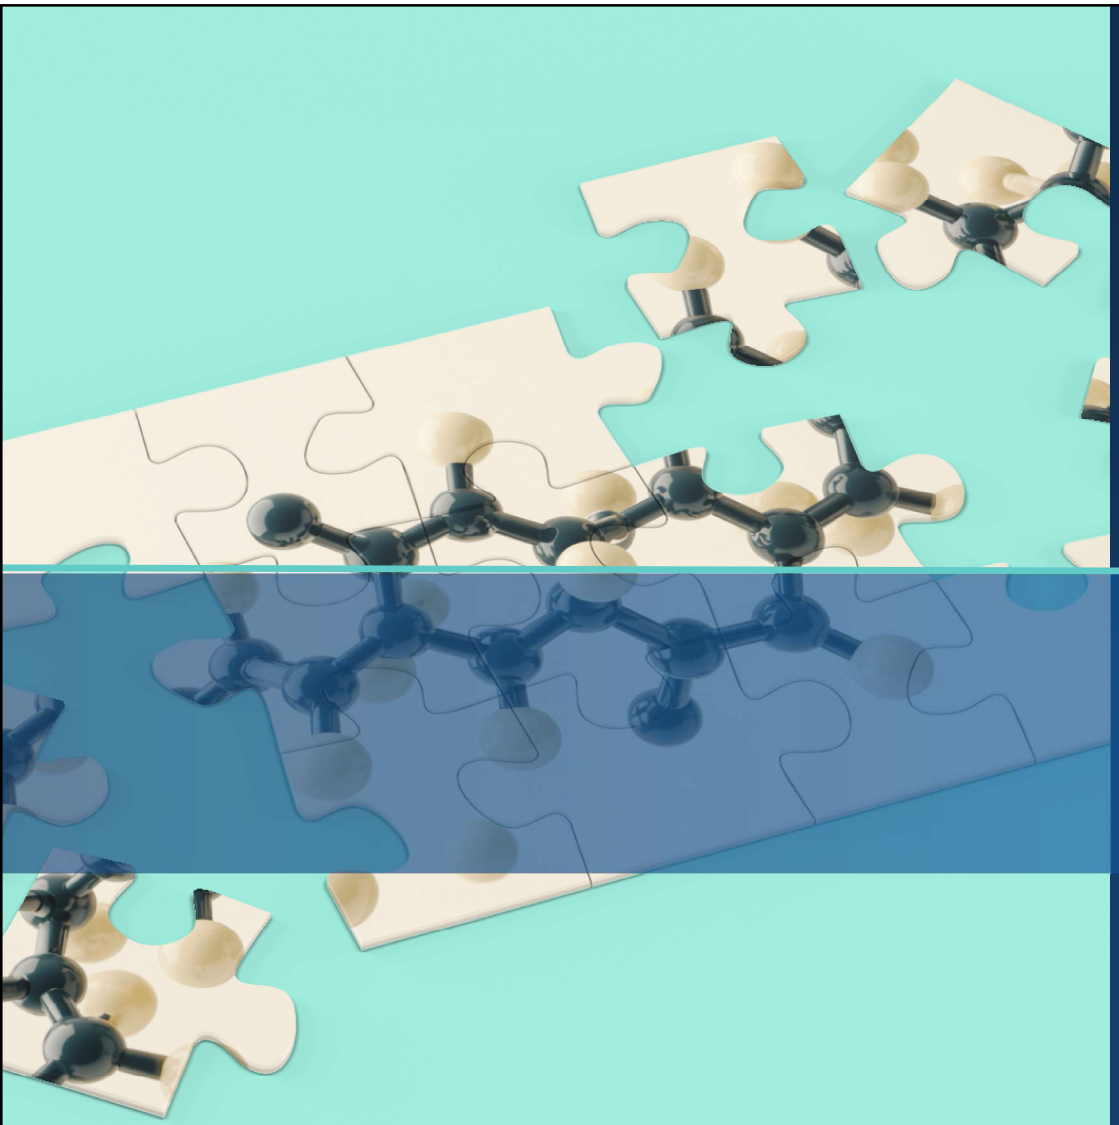
Case 1 – FU Testing

	10/2013	5/2014	10/2014
ACTH (pg/ML)	14	8	2
DHEAS (µg/dL)	126	71	41
ONDST (µg/dL)	1.4	2.1	2.1

Summary: Treatment & Outcome

- Laparoscopic Left Adrenalectomy
  - Resolution of HTN, Normalization of Glucose
  - Physical Findings & Weight Returned to Normal
- But What if She Could Not Have Surgery?
  - Mifepristone For Glucose + Spironolactone for HTN
  - Osilodrostat or Levoketoconazole Carefully Titrate
  - Clinical Trial or Off-Label Treatments
  - Conventional BP & DM Meds Achieve Worse Outcomes

Expert Opinion.



Case 2

60yr old male with abdominal pain

Case 2 Presentation

- 60 years old male patient referred for the incidental finding of bilateral adrenal nodular hyperplasia at CT scan performed for abdominal pain
- Familiar medical history: no hypertension, no diabetes, no endocrinopathies
- Physiologic history: normal physical development; normal gastro-intestinal functions
- Previous medical history: hypertension (onset at 40 yrs); type 2 diabetes detected at age 40. Over the past 6 months, rapid weight gain (10 kg), mild depression mood and erectile disfunction have developed.

Case 2 Presentation (Cont)

- Current therapy: metformin 1 gr BID, valsartan (160 mg/day), amlodipine 10 mg/day, doxazosin 4 mg/day, paroxetine 10 mg/day
- Examination findings: height 175 cm, weight 78 kg, BMI 25.4, BP 135/85,
- Symptoms and physical evaluation: myalgias, weakness, poor libido
- Early laboratory results: mild leucocytosis 12000/µL, glucose 155 mg/dL, HbA1C 7.5%, electrolyte normal, creatinine 0.9 mg/dL, normal thyroid function and calcium-phosphate metabolism

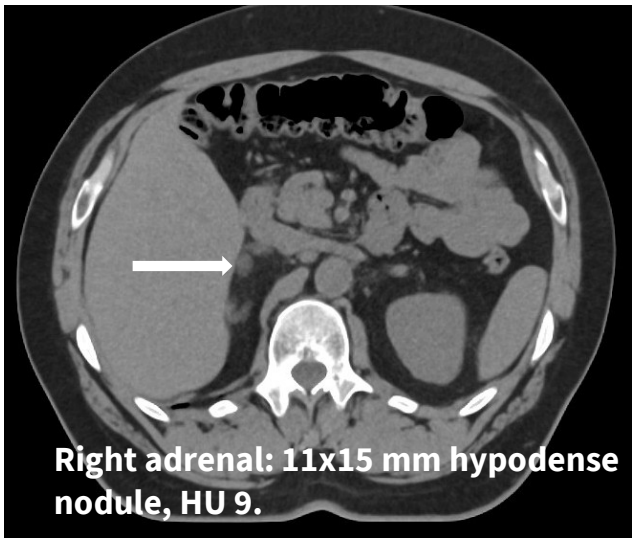
Approach to this Patient (at the 1° visit)

Do you think that this patient should be screened for hypercortisolism and, if yes, **why?**

Diagnosis (2 months after 1° visit)

Endocrine Assessment

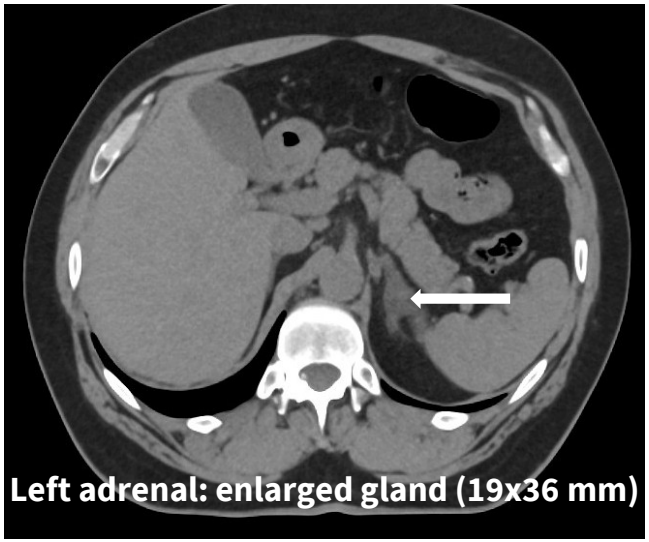
- F-1mgDST: 2.1 µg/dL (vn <1.8)
- LNSalC: 1.97 µg/L (<2.08)
- UFC: 115 µg/24h (nv 15-120)
- Testosterone: 290 ng/dL (nv 300-700)



Right adrenal: 11x15 mm hypodense nodule, HU 9.

Endocrine Assessment

- ACTH 15-16-16 pg/mL (nv 5-55)
- DHEAS 3300 ng/L (nv 650-4700)
- FG: 115 mg/dL (nv 70-110)
- HbA1C: 6.4%



Left adrenal: enlarged gland (19x36 mm)

What diagnosis?

- Non functioning nodular adrenal hyperplasia
- ACTH independent hypercortisolism
- ACTH dependent hypercortisolism

Management

The patient was initially diagnosed as affected by

“ACTH independent hypercortisolism associated with hypertension and type 2 diabetes”.

The patient underwent right adrenal surgery by robot assisted laparoscopy

Are the diagnosis and diagnostic work-up correct?

- Do you think that the diagnosis is correct?
- Are there other comorbidities that should have been studied?

Diagnosis: Comorbidities

- Spinal x-ray: L1 morphometric vertebral fracture (30%) II Grade
- Bone mineral density by Dual X ray Absorptiometry
    - Lumbar spine (L2-L4) T-score L2-L4 -2.6 (Z-score -2.2)
    - Femoral neck T-score -1.8 (Z-score -1.5)
    - Total Hip T-score -1.9 (Z-score -1.6)
- 24h BP monitoring: diurnal adequate control (diurnal BP 132/82 mmHg), but loss of circadian rhythm (nocturnal BP 125/82)

Follow up (4 months after adrenal surgery)

No secondary hypocortisolism

Clinical features:

- Persistence of symptoms
- Stable blood pressure
- Maintenance of full anti-hypertensive therapy
- Stable glucometabolic control
- Stable weight (64 kg)
- Persistence of depressed mood
- Persistence of erectile dysfunction

Endocrine assessment:

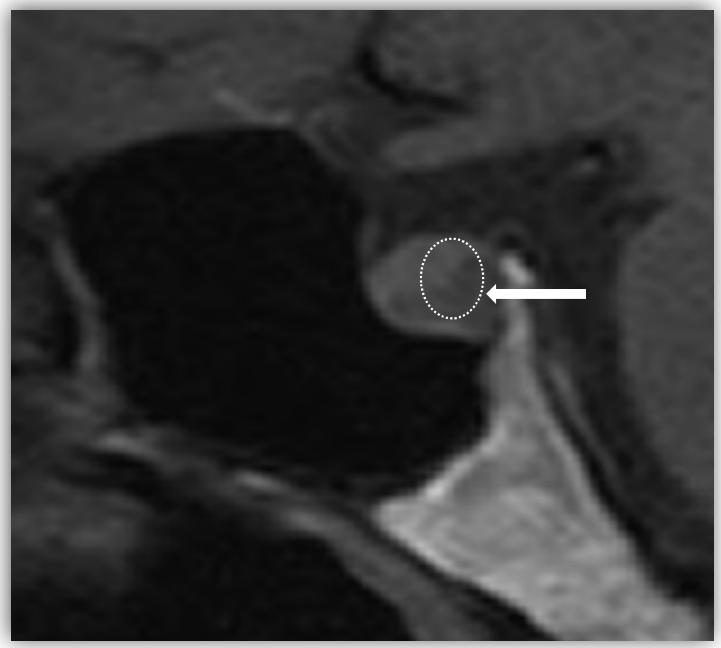
- Morning Cortisol: 19 µg/dL (nv 5-20)
- ACTH 49 pg/mL (nv 5-55)
- LNSalC: 2.1 µg/L (<2.08)
- F-1mgDST: 2.5 µg/dL (vn <1.8)
- UFC: 110 µg/24h (nv 15-120)
- DHEAS 4300 ng/L (nv 650-4700)
- Testosterone: 270 ng/dL (nv 300-700)
- FG: 136 mg/dL (nv 70-110)
- HbA1C: 8.5%

What diagnosis? (more than 1 is possible)

- Non functioning adrenal hyperplasia
- Persistent ACTH independent hypercortisolism
- ACTH-dependent hypercortisolism

Diagnosis: ACTH dependent hypercortisolism (8 months after adrenal surgery)

- ACTH 55-45 pg/mL (nv 5-55)
- F-1mgDST: 3.5 µg/dL (vn <1.8)
- CRH-test: ACTH 55→ 160 pg/mL (>100%)
- F-8mgDST: cortisol 22 → 5 µg/dL (>50%)
- LNSC 5.3 µg/dL (nv <4.0)
- UFC: 130 µg/24h (nv 15-120)
- FG: 140 mg/dL (nv 70-110)
- HbA1C: 9.5



MRI: 8 mm iso-to hyperintense on T2-weighted images pituitary lesion

Follow-up (6 months after pituitary surgery)

- The patient was diagnosed with *"ACTH-dependent hypercortisolism of pituitary origin"* and underwent pituitary surgery.
- Secondary hypocortisolism occurred
- She was initiated with cortisone acetate 25 mg/day (3 fractionated daily doses)

Clinical features

- Hypocortisolism
- Controlled BP and normal BP circadian rhythm
- Reduction of anti-hypertensive therapy to only amlodipine 5 mg/day
- Normalized FG levels and metformin withdrawn
- 4 kg weight loss
- Disappearance of depressed mood
- Amelioration of libido and erectile dysfunction
- Disappearance of hypogonadism

Endocrine assessment

- Morning cortisol 2 µg/dL
- ACTH 20 pg/mL (nv 5-55)
- F-1mgDST: 0.5 µg/dL (vn <1.8)
- UFC: 18 µg/24h (nv 15-120)
- 75-OGTT: Glucose 86-102 mg/dL
- HbA1C: 5.9%
- Testosterone: 490 ng/dL (nv 300-700)

Summary

- In a patient with unexplainable hypertension and/or altered glucose metabolism the presence of hypercortisolism should be investigated
- The presence of an adrenal nodule in the context of hypercortisolism should not be considered definitive proof of ACTH independence
- In patients with hypercortisolism the presence of asymptomatic vertebral fracture, altered BP circadian rhythm, glucose intolerance and/or diabetes should be investigated.

Interprofessional Team Overview: What is the Role(s) of the Care Team?

Physicians: Endocrinologists work with primary care, internists, neurosurgeons, endocrine surgeons, radiologists, pathologists

- Screen, diagnose, determine and oversee treatment plans

Advanced Practice Providers: Nurse Practitioners, Physician Assistants

- Perform patient assessments, manage symptoms, provide follow-up care, and support treatment delivery in collaboration with physicians

Clinical Pharmacy Specialists:

- Optimize pharmacologic treatment plans, educate patients on medication use and side effects, and answer drug information questions

Nurses:

- Provide day-to-day care coordination, triage symptoms, administer treatments, and serve as key points of patient contact
- Educate patients and families about care plans and procedures

Social Workers:

- Address psychosocial needs, coordinate resources (transportation, financial support, counseling), and facilitate communication between patients, families, and the care team

Clinical Takeaways

- In patients with unilateral cortisol secreting adenoma and hypercortisolism, laparoscopic adrenalectomy is the treatment of choice
- Laparoscopic adrenalectomy leads to amelioration of HTN and amelioration/normalization of glucometabolic control
- The presence of an adrenal nodule in the context of hypercortisolism should not be considered definitive proof of ACTH independence
- In patients with hypercortisolism the presence of asymptomatic vertebral fracture, altered BP circadian rhythm, glucose intolerance and/or diabetes should be investigated

To claim your credit for this activity, please be sure to complete the posttest and evaluation at the conclusion of the presentation.
